

TECHNICAL DATA SHEET SALINOFIX®

PRODUCT LINE

5005 09 HARDENING AGENT FOR DEMINERALIZED WATER

APPLICATION

SALINOFIX® is a product used to adjust the total hardness of water for offset printing, and contains no constituents that might interfere with the printing process.

When demineralization or reverse-osmosis systems are used in print shops, blending to a total hardness of 140 to 180 ppm calciumcarbonate is recommended before the processed water should be used for offset printing.

Demineralized water from reverse-osmosis systems and even water containing **SALINOFIX®** both have a slightly corrosive effect on metals. All pipes and fittings should therefore consist of either plastic or stainless steel.

SPECIAL CHARACTERISTICS

- Re-hardens water to the recommended degree of hardness
- Contains no constituents that might interfere with the printing process

PROPERTIES

Product Line	Dosage	Recommended Hardness
5005 09	0.5%	140 – 180 ppm

PACKAGING

Plastic Jug 2.5 US gallon 9.46 L
Plastic Jug 5.0 US gallon 18.9 L
Plastic Drum 55.0 US gallon 208.1 L
